

18. Technical Risk Analysis – Exploiting the Power of MBSE

Despina Tramoundanis¹, Wayne Power¹ and Daniel Spencer²

¹Weapons Systems Division, DSTO and ²Aerospace Concepts

Abstract

In his 2003 review into Defence procurement, Kinnaird recommended that for new acquisitions Defence undertake a '*comprehensive analysis of technology, cost and schedule risks'* and that '*Government needs to be assured that adequate scrutiny is undertakenby DSTO on technology feasibility, maturity and overall technical risk*'. As a result, DSTO performs Technical Risk Assessments (TRA) to inform major acquisition decisions during the Requirements phase of the Capability Development process.

Instructions for preparing the TRA are found in the Technical Risk Assessment Handbook (TRAH)¹⁷. These instructions provide useful guidance on the nature of technology and technical risks and means for risk discovery and assessment.

The current TRA development practice has several shortcomings, including:

- Existing templates do not necessarily fit every type of acquisition project.
- At the early stages of capability definition, before a materiel solution has been selected, system decomposition is not always possible.
- The level of discipline and rigour applied to risk analysis is variable depending on the skills of individuals.
- System integration risk does not receive adequate coverage.
- The TRA is a stand-alone document meaning that the risk analysis is not necessarily integrated with the capability definition.
- It is not easy to see how risks in one part of the system impact risks in other parts of the system that may be directly or indirectly coupled.

To address several of these shortcomings, this paper introduces the concept of Functional Risk Analysis (FRA) conducted within a Model Based Systems Engineering (MBSE) environment. FRA is a rigorous technique used to explore potential effects of functional failures or degradation that result from insufficient technical readiness, both within and between parts of a system and across system interfaces. (FRA is analogous to Functional Hazard Analysis, a technique applied in the aerospace domain.) The underlying method of FRA uses an Enhanced Functional Flow Block Diagram (EFFBD) representation of the system functionality and follows the following procedure:

1. Perform the following steps on each function in turn:
 - a. Define the purpose and behaviour of the function.
 - b. Consider the technologies inherent in the function and the potential failure modes that may result based on an understanding of the technology readiness,

- e.g. 'complete loss of function', 'degraded performance', 'incorrect operation (e.g. high, low, fast, slow etc ...)'.
 - c. Represent functional failure modes within MBSE model.
- 2. Simulate or interrogate the functional model to assess the potential impact of functional failures on downstream functions and guide detailed system analysis.
- 3. Record in the MBSE model the identified risks (i.e. the potential effect in terms of severity and probability of occurrence).

Once the physical system has been designed or selected, the FRA procedure can be repeated using the system architecture to assess and explore the effects of component failures or degradation that result from insufficient system readiness. The results of the FRA are recorded in the MBSE model from which the TRA report is auto-generated via the running of scripts. This paper will use a generic weapon system example to illustrate the FRA technique.

Presenter Biography

Despina Tramoundanis was a Royal Australian Air Force Armaments Engineer for 20 years before joining DSTO's Weapons Systems Division. She is currently the S&T advisor for a Ground-Based Air and Missile Defence project. Her current research interests include development of the Whole-of-System Analytical Framework, a Model-Based Capability Engineering methodology for the provision of cross-Defence modeling, simulation, analysis and Capability Development activities. She holds a Bachelor of Engineering (Chemical) from Monash University, an MSc in Explosives Engineering from Cranfield University (UK), a Master of Defence Studies from UNSW and a Master of Defence Operations Research from UNSW.

Wayne Power graduated with honours from the Queensland University of Technology (QUT) with a Bachelor of Engineering (Aerospace Avionics), minor in Systems Engineering. He has spent the last six years working in Weapons Capability Analysis within DSTO's Weapons Systems Division (WSD). His work in WSD has included weapon system integration modelling and analysis, but the major focus of his work has revolved around researching and developing the Whole-of-System Analytical Framework (WSAF). The WSAF employs a Model-Based Systems Engineering approach for the provision of cross-Defence modelling, simulation, analysis and Capability Development activities.

Daniel Spencer works as a systems engineer for Aerospace Concepts Pty Ltd. He has over a decade of experience in design and development of systems solutions across a broad range of industries, both in Australia and the United Kingdom. Dan holds a Bachelor of Engineering in Information Technology and Telecommunications from the University of Adelaide. He has been working with Australian Defence clients developing and refining tools and methods for a repeatable and comprehensive MBSE method, while using this approach for real-world capability definition and development projects.

UNCLASSIFIED – For Public Release

Shortcomings

- TRA templates do not fit every type of acquisition
- Work only with materiel solutions
- Quality depends on the skills of individuals
- Inadequate analysis of:
 - System integration risk
 - Risk coupling
- TRA is a stand-alone document

UNCLASSIFIED – For Public Release

UNCLASSIFIED – For Public Release

The Need

A rigorous technique to explore the potential effects of functional failures and performance degradation that result from insufficient technical readiness, both within and between parts of a system and across system interfaces

Required model state

- Functional decomposition defined
- Functional flows modelled
- Information flows modelled and connected to functions

} Required for
EFFBD
representation

If a materiel system does not exist:

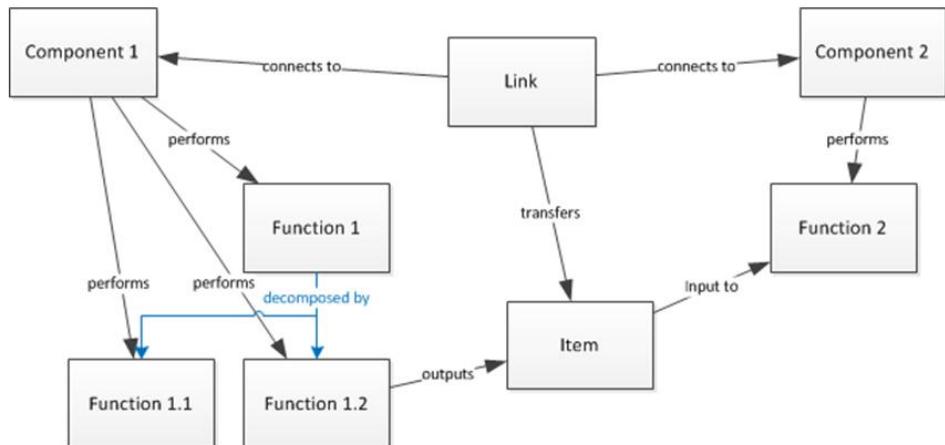

- Perform risk analysis on available technologies to perform functions
- Identify *indicative risk areas* in achieving functional and operational outcomes due to technology maturity issues
- Repeat FRA when the materiel system is known.

UNCLASSIFIED

UNCLASSIFIED – For Public Release

FRA Process (*Modified FMEA Process*)

1. Determine objectives
 - To identify, analyse and evaluate risks related to technical readiness
2. Identify starting points for analysis (*mode*)
3. Identify *upstream mechanisms* (causes)
4. Identify *downstream effects* (impact on system performance and mission outcomes)
5. Analyse and record overall risk (**trace to affected mission outcomes**)

UNCLASSIFIED – For Public Release

UNCLASSIFIED – For Public Release

3. Consider upstream causes of functional failure

- Use tool support to produce report on “success path”
- Start from chosen function, consider:
 - “*triggered by*” items: Will always impact flow
 - “*inputs*” items: May affect quality of flow
- For the items collected, consider the other functions they are “*output from*”:
 - If multiple “*output from*”: Redundancies in path
- Continue backwards through the success path

UNCLASSIFIED – For Public Release

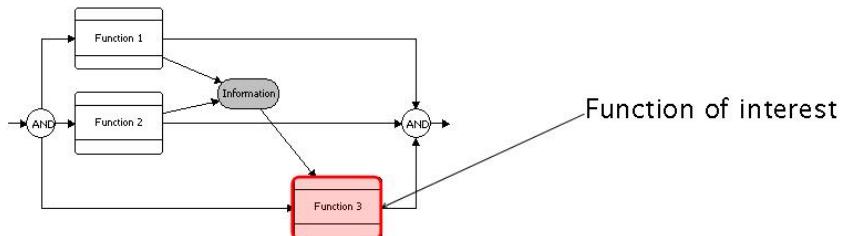

UNCLASSIFIED

DSTO-GD-0734

UNCLASSIFIED – For Public Release

Upstream risk patterns

Redundancy – decreased likelihood

DSTO

UNCLASSIFIED – For Public Release

UNCLASSIFIED – For Public Release

4. Consider downstream effects of functional failure

- Use tool support to produce report on “success path”
- For each function, consider the items it “outputs”
- For each item, consider:
 - “*triggers*” functions: May impact flow, but also need to consider if other functions are able to output this item
 - “*input to*” functions: May affect quality of flow
- Continue forward through the success path

DSTO

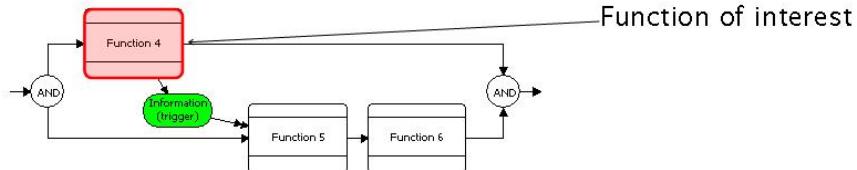

UNCLASSIFIED – For Public Release

UNCLASSIFIED

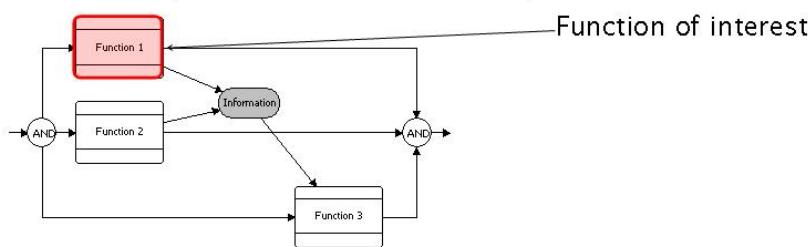

UNCLASSIFIED – For Public Release

Downstream risk patterns

Critical path – significant consequence

Redundancy – decreased consequence

**DSTO**

UNCLASSIFIED – For Public Release

UNCLASSIFIED – For Public Release

Analyse and record resulting risk

- Create technical risk element in the model, related to the Function / Item / Link analysed
- Record risk ratings (likelihood, consequence) and mitigation strategies
- Output Technical Risk documentation from the model
- Risk can result in a design decision and derived Requirement

DSTO

UNCLASSIFIED – For Public Release

UNCLASSIFIED

DSTO-GD-0734

UNCLASSIFIED – For Public Release

5. Analyse and record resulting risk

Likelihood	Consequence/Impact		
	Minor	Moderate	Major
More Than Likely	MEDIUM	HIGH	HIGH
Less Than Likely	LOW	MEDIUM	HIGH
Unlikely	LOW	LOW	MEDIUM

Benefits of methodology/ Conclusions

Issues with current practice	FRA Benefit
TRA templates do not fit every type of acquisition	Focus of risk analysis is on a model of the capability of interest, not on a document template. Documentation is derived from the risk analysis, not the other way around.
Need to assume a materiel solution	FRA can be applied to a functional description of a system using knowledge of available technologies (pre-2 nd pass) and is repeated for physical systems at 2 nd Pass.
Quality depends on the skills of individuals	Provides a rigorous process to assist in the analysis of whole of system technical risk
Inadequate analysis of: System integration risk Risk coupling	Process guides analyst through the potential influence of technologies on other systems and subsystems. Focus is on potential impact of integration risk
TRA is a stand-alone document	Analysis performed in and risks recorded in the same model OCD and FPS definitions. Completely traceable: a single source of truth.

UNCLASSIFIED

DSTO-GD-0734

UNCLASSIFIED – For Public Release

Additional Benefits / conclusions

Resulting benefits from using MBSE for risk analysis:

- Capture and trace risks and issues to mission objectives
- Capture non-technical risks/issues (such fitness-for-purpose)
- Can extend FRA process to system assessment
- Resulting derived requirements can be traceable back to the analysis process
